10. TECHNICAL QUESTIONNAIRE .............................................................................................................33
1. SUBJECT OF THE PROTOCOL AND REPORTING

1.1 Scope of the technical protocol

This Technical Protocol applies to all varieties of *Capsicum annuum* L..

1.2 Entry into Force

The present protocol enters into force on **01.04.2020**. Any ongoing DUS examination of candidate varieties started before the aforesaid date will not be affected by the approval of the Technical Protocol. Technical examinations of candidate varieties are carried out according to the TP in force when the DUS test starts. The starting date of a DUS examination is considered to be the due date for submitting of plant material for the first test period.

In cases where the Office requests to take-over a DUS report for which the technical examination has either been finalized or which is in the process to be carried out at the moment of this request, such report can only be accepted if the technical examination has been carried out according to the CPVO TP which was in force at the moment when the technical examination started.

1.3 Reporting between Examination Office and CPVO and Liaison with Applicant

1.3.1 Reporting between Examination Office and CPVO

The Examination Office shall deliver to the CPVO a preliminary report ("the preliminary report") no later than two weeks after the date of the request for technical examination by the CPVO.

The Examination Office shall also deliver to the CPVO a report relating to each growing period ("the interim report") and, when the Examination Office considers the results of the technical examination to be adequate to evaluate the variety or the CPVO so requests, a report relating to the examination ("the final report").

The final report shall state the opinion of the Examination Office on the distinctness, uniformity and stability of the variety. Where it considers those criteria to be satisfied, or where the CPVO so requests, a description of the variety shall be added to the report.

If a report is negative the Examination Office shall set out the detailed reasons for its findings.

The interim and the final reports shall be delivered to the CPVO as soon as possible and no later than on the deadlines as laid down in the designation agreement.

1.3.2 Informing on problems in the DUS test

If problems arise during the course of the test the CPVO should be informed immediately so that the information can be passed on to the applicant. Subject to prior permanent agreement, the applicant may be directly informed at the same time as the CPVO particularly if a visit to the trial is advisable.

1.3.3 Sample keeping in case of problems

If the technical examination has resulted in a negative report, the CPVO shall inform the Examination Office as soon as possible in case that a representative sample of any relevant testing material shall be kept.

2. MATERIAL REQUIRED

2.1 Plant material requirements

Information with respect to the agreed closing dates and submission requirements of plant material for the technical examination of varieties can be found on [http://cpvo.europa.eu/applications-and-examinations/technical-examinations/submission-of-plant-material-s2-publication](http://cpvo.europa.eu/applications-and-examinations/technical-examinations/submission-of-plant-material-s2-publication) in the special issue S2 of the Official Gazette of the Office. General requirements on submission of samples are also to be found following the same link.
2.2 Informing the applicant of plant material requirements

The CPVO informs the applicant that

- he is responsible for ensuring compliance with any customs and plant health requirements.
- the plant material supplied should be visibly healthy, not lacking in vigour, nor affected by any important pest or disease.
- the plant material should not have undergone any treatment which would affect the expression of the characteristics of the variety, unless the competent authorities allow or request such treatment. If it has been treated, full details of the treatment must be given.

2.3 Informing about problems on the submission of material

The Examination Office shall report to the CPVO immediately in cases where the test material of the candidate variety has not arrived in time or in cases where the material submitted does not fulfil the conditions laid down in the request for material issued by the CPVO.

In cases where the examination office encounters difficulties to obtain plant material of reference varieties the CPVO should be informed.

3. METHOD OF EXAMINATION

3.1 Number of growing cycles

The minimum duration of tests should normally be two independent growing cycles.

3.2 Testing Place

Tests are normally conducted at one place. In the case of tests conducted at more than one place, guidance is provided in TGP/9 "Examining Distinctness" [http://www.upov.int/edocs/tgpdocs/en/tgp_9.pdf].

3.3 Conditions for Conducting the Examination

The tests should be carried out under conditions ensuring satisfactory growth for the expression of the relevant characteristics of the variety and for the conduct of the examination.

3.4 Test design

3.4.1 Each test should be designed to result in a total of at least 20 plants, which should be divided between at least 2 replicates.

3.4.2 The design of the tests should be such that plants or parts of plants may be removed for measurement or counting without prejudice to the observations which must be made up to the end of the growing cycle.

3.5 Special tests for additional characteristics

In accordance with Article 23 of Implementing Rules N° 874/2009 an applicant may claim either in the Technical Questionnaire or during the test that a candidate has a characteristic which would be helpful in establishing distinctness. If such a claim is made and is supported by reliable technical data, a special test may be undertaken providing that a technically acceptable test procedure can be devised.

Special tests will be undertaken, with the agreement of the President of CPVO, where distinctness is unlikely to be shown using the characters listed in the protocol.

3.6 Constitution and maintenance of a variety collection

The process for the constitution and the maintenance of a variety collection can be summarized as follows:

Step 1: Making an inventory of the varieties of common knowledge

Step 2: Establishing a collection ("variety collection") of varieties of common knowledge which are relevant for the examination of distinctness of candidate varieties

Step 3: Selecting the varieties from the variety collection which need to be included in the growing trial or other tests for the examination of distinctness of a particular candidate /variety.
3.6.1 Forms of variety collection
(a) Seed propagated agricultural and vegetable species and fruit species specified on the annex 1 of the entrustment requirements
The variety collection shall comprise variety descriptions and living plant material, thus a living reference collection. The variety description shall be produced by the EO unless special cooperation exists between EOs and the CPVO. The descriptive and pictorial information produced by the EO shall be held and maintained in a form of a database.

(b) Vegetatively propagated agricultural and vegetable species
The variety collection shall comprise variety descriptions; no living reference collection is required. The variety description shall be produced by the EO unless special cooperation exists between EOs and the CPVO. The descriptive and pictorial information produced by the EO shall be held and maintained in a form of a database.

3.6.2 Living Plant Material
(a) Seed propagated agricultural and vegetable species and fruit species specified on the annex 1 of the entrustment requirements
The EO shall collect and maintain living plant material of varieties of the species concerned in the variety collection.

(b) Ornamental species, vegetatively propagated agricultural and vegetable species and fruit species not specified on the annex 1 of the entrustment requirements
The EO shall obtain living plant material of reference varieties as and when those varieties need to be included in growing trials or other tests.

3.6.3 Range of the variety collection
The living variety collection shall cover at least those varieties that are suitable to climatic conditions of a respective EO.

3.6.4 Making an inventory of varieties of common knowledge for inclusion in the variety collection
The inventory shall include varieties protected under National PBR (UPOV contracting parties) and Community PBR, varieties registered in the Common Catalogue, the OECD list, the Conservation variety list and varieties in trade or in commercial registers for those species not covered by a National or the Common Catalogue.

3.6.5 Maintenance and renewal/update of a living variety collection
(a) Seed propagated species
The EO shall maintain seeds in conditions which will ensure germination and viability, periodical checks, and renewal as required. For the renewal of existing living material the identity of replacement living plant material shall be verified by conducting side-by-side plot comparisons between the material in the collection and the new material.

(b) Vegetatively propagated species
The EO shall maintain the variety collection under appropriate growing conditions (e.g. glasshouse, orchard, in vitro), where it shall be ensured that the plants are adequately irrigated, fertilised, pruned and protected from harmful pests and diseases. For the renewal of existing living material the identity of replacement living plant material shall be verified by conducting side-by-side plot comparisons between the material in the collection and the new material or by checking the identity of the new material against the variety description.

4. ASSESSMENT OF DISTINCTNESS, UNIFORMITY AND STABILITY
The prescribed procedure is to assess distinctness, uniformity and stability in a growing trial.

4.1 Distinctness

4.1.1 General recommendations
It is of particular importance for users of this Technical Protocol to consult the UPOV-General Introduction to DUS (link in chapter 1 of this document) and TGP 9 ‘Examining Distinctness’ (http://www.upov.int/edocs/tgpdocs/en/tgp_9.pdf) prior to making decisions regarding distinctness. However, the following points are provided for elaboration or emphasis in this Technical Protocol.

4.1.2 Consistent differences
The differences observed between varieties may be so clear that more than one growing cycle is not necessary. In addition, in some circumstances, the influence of the environment is not such that more than a single growing cycle is required to provide assurance that the differences observed between varieties are sufficiently consistent. One means of ensuring that a difference in a characteristic, observed in a growing trial, is sufficiently consistent is to examine the characteristic in at least two independent growing cycles.
4.1.3 **Clear differences**
Determining whether a difference between two varieties is clear depends on many factors, and should consider, in particular, the type of expression of the characteristic being examined, i.e. whether it is expressed in a qualitative, quantitative, or pseudo-qualitative manner. Therefore, it is important that users of these Technical Protocols are familiar with the recommendations contained in the UPOV-General Introduction to DUS prior to making decisions regarding distinctness.

4.1.4 **Number of plants/parts of plants to be examined**
Unless otherwise indicated, for the purposes of distinctness, all observations on single plants should be made on 20 plants or parts taken from each of 20 plants and any other observations made on all plants in the test, disregarding any off-type plants. In the case of observations of parts taken from single plants, the number of parts to be taken from each of the plants should be 20. Also for testing of the resistance to certain pathogens, unless otherwise indicated, the test should be performed on at least 20 plants.

4.1.5 **Method of observation**
The recommended method of observing the characteristic for the purposes of distinctness is indicated by the following key in the third column of the Table of Characteristics (see document TGP/9 "Examining Distinctness", Section 4 "Observation of characteristics"):

- **MG**: single measurement of a group of plants or parts of plants
- **MS**: measurement of a number of individual plants or parts of plants
- **VG**: visual assessment by a single observation of a group of plants or parts of plants
- **VS**: visual assessment by observation of individual plants or parts of plants

Type of observation: visual (V) or measurement (M)
"Visual" observation (V) is an observation made on the basis of the expert's judgment. For the purposes of this document, "visual" observation refers to the sensory observations of the experts and, therefore, also includes smell, taste and touch. Visual observation includes observations where the expert uses reference points (e.g. diagrams, example varieties, side-by-side comparison) or non-linear charts (e.g. colour charts). Measurement (M) is an objective observation against a calibrated, linear scale e.g. using a ruler, weighing scales, colorimeter, dates, counts, etc.

Type of record: for a group of plants (G) or for single, individual plants (S)
For the purposes of distinctness, observations may be recorded as a single record for a group of plants or parts of plants (G), or may be recorded as records for a number of single, individual plants or parts of plants (S). In most cases, "G" provides a single record per variety and it is not possible or necessary to apply statistical methods in a plant-by-plant analysis for the assessment of distinctness.

In cases where more than one method of observing the characteristic is indicated in the Table of Characteristics (e.g. VG/MG), guidance on selecting an appropriate method is provided in document TGP/9, Section 4.2.

4.2 **Uniformity**
It is of particular importance for users of this Technical Protocol to consult the UPOV-General Introduction to DUS (link in chapter 1 of this document) and TGP 10 'Examining Uniformity' ([link](http://www.upov.int/edocs/tgpdocs/en/tgp_10.pdf)) prior to making decisions regarding uniformity. However, the following points are provided for elaboration or emphasis in this Technical.

(a) **Cross-pollinated varieties**
The assessment of uniformity should be according to the recommendations for cross-pollinated varieties in the UPOV-General Introduction to DUS.

For the assessment of uniformity of open-pollinated varieties, a population standard of 2% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 20 plants, 2 off-types are allowed.

(b) **Hybrid varieties**
For the assessment of uniformity of hybrids, a population standard of 1% and an acceptance probability of at least 95% should be applied. In the case of a sample size of 20 plants, 1 off-type is allowed.
4.3 Stability

4.3.1 It is of particular importance for users of this Technical Protocol to consult the UPOV-General Introduction to DUS (link in chapter 1 of this document) and TGP 11 'Examining Stability' (http://www.upov.int/edocs/tgpdocs/en/tgp_11.pdf)

In practice, it is not usual to perform tests of stability that produce results as certain as those of the testing of distinctness and uniformity. However, experience has demonstrated that, for many types of variety, when a variety has been shown to be uniform, it can also be considered to be stable.

4.3.2 Technical Protocols covering both seed-propagated and vegetatively propagated varieties

Where appropriate, or in cases of doubt, stability may be further examined by testing a new seed or plant stock to ensure that it exhibits the same characteristics as those shown by the initial material supplied.

5. GROUPING OF VARIETIES AND ORGANISATION OF THE GROWING TRIAL

5.1 The selection of varieties of common knowledge to be grown in the trial with the candidate varieties and the way in which these varieties are divided into groups to facilitate the assessment of distinctness are aided by the use of grouping characteristics.

5.2 Grouping characteristics are those in which the documented states of expression, even where produced at different locations, can be used, either individually or in combination with other such characteristics: (a) to select varieties of common knowledge that can be excluded from the growing trial used for examination of distinctness; and (b) to organise the growing trial so that similar varieties are grouped together.

5.3 The following have been agreed as useful grouping characteristics.

a) Seedling: anthocyanin coloration of hypocotyl (characteristic 1)
b) Plant: shortened internode (in upper part) (characteristic 3)
c) Fruit: colour (before maturity) (characteristic 20)
d) Fruit: shape in longitudinal section (characteristic 27)
e) Fruit: colour (at maturity) (characteristic 32)
f) Fruit: capsaicin in placenta (characteristic 44)
g) Resistance to *Tobamovirus, Tobacco Mosaic Virus* Pathotype 0 (TMV: P0) (characteristic 47.1)
h) Resistance to *Tobamovirus, Pepper Mild Mottle Virus* Pathotype 1-2 (PMMoV: 1-2) (characteristic 47.2)
i) Resistance to *Tobamovirus, Pepper Mild Mottle Virus* Pathotype 1-2-3 (PMMoV: 1-2-3) (characteristic 47.3)
j) Resistance to *Potato Y Virus* Pathotype 0 (PYV: 0) (characteristic 48.1)
k) Resistance to *Tomato spotted wilt virus* Pathotype 0 (TSWV: 0) (characteristic 51)

5.4 If other characteristics than those from the Technical Protocol are used for the selection of varieties to be included into the growing trial, the EO shall inform the CPVO and seek the prior consent of the CPVO before using these characteristics.

5.5 Guidance for the use of grouping characteristics, in the process of examining distinctness, is provided through the UPOV-General Introduction to DUS and document TGP/9 “Examining Distinctness”.
6. INTRODUCTION TO THE TABLE OF CHARACTERISTICS

6.1 Characteristics to be used

The characteristics to be used in DUS tests and preparation of descriptions shall be those referred to in the table of characteristics. All the characteristics shall be used, providing that observation of a characteristic is not rendered impossible by the expression of any other characteristic, or the expression of a characteristic is prevented by the environmental conditions under which the test is conducted or by specific legislation on plant health. In the latter case, the CPVO should be informed.

The Administrative Council empowers the President, in accordance with Article 23 of Commission Regulation N°874/2009, to insert additional characteristics and their expressions in respect of a variety.

Asterisked characteristics
In the case of disease resistance characteristics, only those resistances marked with an asterisk (*) in the CPVO column are compulsory.

6.2 States of expression and corresponding notes

In the case of qualitative and pseudo-qualitative characteristics, all relevant states of expression are presented in the characteristic. However, in the case of quantitative characteristics with 5 or more states, an abbreviated scale may be used to minimize the size of the Table of Characteristics. For example, in the case of a quantitative characteristic with 9 states, the presentation of states of expression in the Test Guidelines may be abbreviated as follows:

<table>
<thead>
<tr>
<th>State</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>small</td>
<td>3</td>
</tr>
<tr>
<td>medium</td>
<td>5</td>
</tr>
<tr>
<td>large</td>
<td>7</td>
</tr>
</tbody>
</table>

However, it should be noted that all of the following 9 states of expression exist to describe varieties and should be used as appropriate:

<table>
<thead>
<tr>
<th>State</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>very small</td>
<td>1</td>
</tr>
<tr>
<td>very small to small</td>
<td>2</td>
</tr>
<tr>
<td>small</td>
<td>3</td>
</tr>
<tr>
<td>small to medium</td>
<td>4</td>
</tr>
<tr>
<td>medium</td>
<td>5</td>
</tr>
<tr>
<td>medium to large</td>
<td>6</td>
</tr>
<tr>
<td>large</td>
<td>7</td>
</tr>
<tr>
<td>large to very large</td>
<td>8</td>
</tr>
<tr>
<td>very large</td>
<td>9</td>
</tr>
</tbody>
</table>

Further explanation of the presentation of states of expression and notes is provided in UPOV document TGP/7 "Development of Test Guidelines".

6.3 Example Varieties

Where appropriate, example varieties are provided to clarify the states of expression of each characteristic.
6.4 Legend

For column 'CPVO N°':

- G Grouping characteristic  
- QL Qualitative characteristic  
- QN Quantitative characteristic  
- PQ Pseudo-qualitative characteristic  
- (+) Explanations for individual characteristics  
- (*) Asterisked characteristic

For column 'UPOV N°':

The numbering of the characteristics is provided as a reference to the UPOV guideline.

- (*) UPOV Asterisked characteristic - Characteristics that are important for the international harmonization of variety descriptions.

For column 'Stage, method':

- MG, MS, VG, VS - see Chapter 4.1.5
- (a)-(x) Explanations covering several Characteristics - see Chapter 8.1

8. EXPLANATIONS ON THE TABLE OF CHARACTERISTICS

8.1 Explanations covering several characteristics

Characteristics containing the following key in the third column of the Table of Characteristics should be examined as indicated below:

a) Fruit characteristics which should be examined before maturity, i.e. before the first colour change.

b) Fruit characteristics which should be examined at maturity, i.e. after the time of the first colour change.

8.2 Explanations for individual characteristics

Ad. 2: Plant: length of stem

The length of the stem is measured from the cotyledons to the first flower branch.

Ad. 3: Plant: shortened internode (in upper part)

Ad. 4: Varieties with shortened internodes only: Plant: number of internodes between flower and shortened internodes

The tests should be done on plants which have not been pruned. The shoot system of pepper consists of main stems, which are branched off from the main axis and side shoots. Two growth types of the main stems can be distinguished:

Growth type A: the main stems grow indeterminately; one or two flowers develop per node and shortened internodes never develop.

Growth type B: after the first branching of the main axis, shorter internodes appear and the growth of the main stem ends in a bunch of flowers (it appears as if there are more than two flowers per node).

Side shoots develop from the nodes on the main axis and on the main stems.

Growth type A

<table>
<thead>
<tr>
<th>Char. 3: Plant: shortened internodes (in upper part)</th>
</tr>
</thead>
<tbody>
<tr>
<td>absent</td>
</tr>
</tbody>
</table>

Growth type B

<table>

</tr>
</thead>
<tbody>
<tr>
<td>none (1)</td>
</tr>
<tr>
<td>one to three (2)</td>
</tr>
<tr>
<td>more than three (3)</td>
</tr>
</tbody>
</table>
Ad. 9: Plant: height

To be observed after a fruit set on several nodes. Poor fruit set may influence the vigour and thus the height of the plant.

Ad. 13: Leaf: shape

1. lanceolate
2. ovate
3. broad elliptic

Ad. 16: Leaf: profile in cross section

1. strongly concave
2. moderately concave
3. flat
4. moderately convex
5. strongly convex

Ad. 18: Peduncle: attitude

1. erect
2. semi drooping
3. drooping
Ad. 27: Fruit: shape in longitudinal section

1. oblate
2. circular
3. cordate
4. square
5. rectangular
6. trapezoidal
7. moderately triangular
8. narrowly triangular
9. horn shaped

Ad. 29: Fruit: sinuation of pericarp at basal part

1. absent or very weak
2. weak
3. medium
4. strong
5. very strong
Ad. 30: Fruit: sinuation of pericarp excluding basal part

1 absent or very weak
3 weak
5 medium
7 strong
9 very strong

Ad. 38: Fruit: depth of interloculary grooves
To be observed in the middle part of the fruit.

Ad. 43: Calyx: apex

1 non enveloping
2 enveloping
Ad. 44: Fruit: capsaicin in placenta

The presence of capsaicin is observed by tasting the pepper flesh together with the locules, in the placenta area.

Ad. 46: Time of maturity

Maturity is reached at the first colour change of the fruit.

Ad. 47: Resistance to Tobamovirus

1. Pathogen: Tobacco mosaic virus and Pepper mild mottle virus
2. Quarantine status: no
3. Host species: Sweet pepper, hot pepper, paprika and chili – Capsicum annuum L.
4. Source of inoculum: GEVES (FR), Naktuinbouw (NL) or INIA (SP)
5. Isolate: Tobacco mosaic virus Pathotype 0 (TMV: 0) strain Vi-6
   Pepper mild mottle virus Pathotype 1-2 (PMMoV: 1-2) strain nt203
   Pepper mild mottle virus Pathotype 1-2-3 (PMMoV: 1-2-3) strain Eve
   The test protocols have been validated in a CPVO co-funded project with these 3 isolates/pathotypes.

S= susceptible; R= resistant; TMV= Tobacco mosaic virus; ToMV= Tomato mosaic virus; PMMoV= Pepper mild mottle virus; TMGmV= Tobacco mild green mosaic virus; BPMoV= Bell pepper mottle virus; PaMMoV= Paprika mild mottle virus
7. Establishment pathogenicity: Test on susceptible plants
8. Multiplication inoculum
8.1 Multiplication medium: Regeneration of the virus of plant material before inoculum preparation.
8.2 Multiplication variety: On susceptible pepper variety, Tobamovirus pathotypes may be multiplied on varieties which are selective for each particular pathotype. For TMV, because tomato and tobacco Nicotiana tabacum cv. Samsun have large leaves and can produce a lot of inocula, they are recommended for the multiplication of TMV: 0.
8.3 Plant stage at inoculation: see 10.3
8.4 Inoculation medium: see 10.1
8.5 Inoculation method: see 10.4
8.6 Harvest of inoculum: Symptomatic fresh leaves
8.7 Check of harvested inoculum: on young leaves of Nicotiana tabacum "Xanthi", check for local lesions after 5-7 days at 20-25°C.
8.8 Shelf life/viability inoculum: fresh > 1 day in fridge, desiccated > 1 year in fridge or juice > 1 year in freezer at -20°C
9. Format of the test
9.1 Number of plants per genotype: At least 20 plants.
9.2 Number of replicates: -
9.3 Control varieties ...................... TMV: 0:
   Susceptible controls: Lamu, Pepita, Piquillo
   Resistant controls: Fehérözön, Yolo Wonder
PMMoV: 1-2:
   Susceptible controls: Fehérözön, Lamu, Yolo Wonder
   Resistant controls: Ferrari, Novi 3
PMMoV: 1-2-3:
   Susceptible controls: Ferrari, Yolo Wonder
   Resistant controls: Friendly, Tom 4
For PMMoV: 1-2-3, it is advised to choose Ferrari as susceptible control because it is resistant to PMMoV: 1-2 or to add the differentials in tests to confirm the pathotype.

9.4 Test design ............................. add non inoculated plants
9.5 Test facility ............................. Climate room or greenhouse
9.6 Temperature ........................... 20-25°C
9.7 Light ................................. 12 hours or longer
9.8 Season ................................. -
9.9 Special measures ..................... -

10. Inoculation
10.1 Preparation inoculum .................. 1 g leaf with symptoms with 10 mL PBS or similar buffer or dilution of juice in water.
   Homogenize, add carborundum to buffer
10.2 Quantification inoculum .......... -
10.3 Plant stage at inoculation ....... TMV: 0, cotyledons to first leaf stage
   PMMoV: 1-2, cotyledon stage
   PMMoV: 1-2-3, cotyledon stage
10.4 Inoculation method................ rubbing with the virus suspension.
10.5 First observation .................... TMV: 0:
   4-7 days post-inoculation for observation of local necrosis.
   PMMoV: 1-2 and PMMoV: 1-2-3:
   4-7 days post-inoculation for observation of local necrotic lesions which can lead to cotyledon drop. After this date these necrosis can hardly be seen on fallen cotyledons.
10.6 Second observation ............... TMV: 0:
   two weeks post-inoculation for observation of symptoms of susceptibility.
   PMMoV: 1-2 and PMMoV: 1-2-3:
   two weeks post-inoculation for observation of symptoms of susceptibility.
10.7 Final observations ................. TMV: 0:
   three weeks post-inoculation.
   PMMoV: 1-2 and PMMoV: 1-2-3:
   three weeks post-inoculation.
   For TMV: 0, PMMoV: 1-2 and PMMoV: 1-2-3, two of these three observations may be sufficient; the third notation is optional for observation of evolution of symptoms (depending on symptoms on controls or heterogeneous behaviour).

11. Observations
11.1 Method ................................. Visual
11.2 Observation scale ....................... TMV: 0:
   Susceptibility: mosaic (aucuba in case of aucuba strain as Vi-6), growth reduction, death of plants.
   Resistance: local necrotic lesions which can lead to leave drop, systemic necrosis, vein necrosis, stem necrosis.
   PMMoV: 1-2 and PMMoV: 1-2-3:
   Susceptibility: mosaic (green), growth reduction.
   Resistance: local necrotic lesions which can lead to cotyledon drop, systemic necrosis.
11.3 Validation of test ................... evaluation of variety resistance should be calibrated with results of resistant and susceptible controls.
12. Interpretation of data in terms of UPOV characteristic states
   absent ......................... [1] susceptible
   present ..................... [9] resistant
13. Critical control points .............. For TMV: 0, plants with no symptoms at all have to be interpreted as escapes of inoculation.
Recommended dates of notation should be adapted depending of expression of symptoms on controls.
Environmental conditions can have an effect on the expression of symptoms over time. In this case a third notation could be necessary.

Ad. 48: Resistance to *Potato Y virus* (*PVY*)

1. Pathogen: *Potato Y virus*
2. Quarantine status: no
3. Host species: Sweet pepper, hot pepper, paprika and chili – *Capsicum annuum* L.
4. Source of inoculum: GEVES (FR), Naktuinbouw (NL) or INIA (SP)
5. Isolate: For *PVY: 0 strain zb6* (the test protocol has been validated in a CPVO co-funded project with this isolate/pathotype).

S = susceptible; R = resistant;

7. Establishment pathogenicity: Test on susceptible plants

8. Multiplication inoculum

8.1 Multiplication medium: Regeneration of the virus on plant material before inoculum preparation.

8.2 Multiplication variety: On susceptible pepper variety, *PVY* Pathotype smay be multiplied on varieties which are selective for each particular pathotype. For PVY: 0, because tobacco *Nicotiana tabacum* cv. *Xanthi-nc* have large leaves and can produce a lot of inocula and have a faster multiplication, they are recommended for the multiplication.

8.3 Plant stage at inoculation: see 10.3

8.4 Inoculation medium: see 10.1

8.5 Inoculation method: see 10.4

8.6 Harvest of inoculum: Symptomatic fresh leaves

8.7 Check of harvested inoculum: option: on *Nicotiana tabacum* cv. *Xanthi-nc*, check mosaic presence and local lesion absence (contamination by Tobamovirus) after 5-7 days.

8.8 Shelf life/viability inoculum: fresh > 1 day, desiccated > 1 year. Because problem of stability of PVY: 0, shipments are recommended to be done with fresh infected leaves

9. Format of the test

9.1 Number of plants per genotype: At least 20 plants.

9.2 Number of replicates: 

9.3 Control varieties: PVY: 0: 

Susceptible controls: Ferrari, Piquillo, Yolo Wonder

Resistant controls: Andalus, Vidi, Yolo Y

PVY: 1: 

Susceptible controls: Yolo Wonder, Yolo Y

Resistant controls: Florida VR2

PVY: 1-2: 

Susceptible controls: Florida VR2, Yolo Wonder, Yolo Y

Resistant controls: Serrano Criollo de Morelos 334

9.4 Test design: add non inoculated plants

9.5 Test facility: Climate room or greenhouse. In case of test in greenhouse during period of low daylight, shadow should not be used.

9.6 Temperature: 18-25°C

9.7 Light: 12 hours or longer

9.8 Season: 

---

5 matref@geves.fr
6 resistente@naktuinbouw.nl
7 resistencias@inia.es
9.9 Special measures ................. For PVY: 0, it is advised to choose Yolo Y as resistant control or to add the differentials in tests to be able to observe a possible contamination by PVY: 1 or 1-2.

10. Inoculation
10.1 Preparation inoculum .......... 1 g leaf with symptoms with 4 mL PBS with carborundum (80mg) and activated carbon (80mg) or similar buffer, homogenize.
10.2 Quantification inoculum ..........
10.3 Plant stage at inoculation ....... PVY: 0 cotyledons stage
PVY: 1 and 1-2: cotyledon stage or first pointing leaf stage
10.4 Inoculation method ............. rubbing with the virus suspension.
10.5 Final observations ............... Three weeks post-inoculation.
11. Observations
11.1 Method ........................................ Visual
11.2 Observation scale ................. Susceptibility: mosaic (can be very light/faint), growth reduction, Vein banding and vein necrosis.
Resistance: no symptoms.
11.3 Validation of test .................. evaluation of variety resistance should be calibrated with results of resistant and susceptible controls.
12. Interpretation of data in terms of UPOV characteristic states
absent ........................................... [1] susceptible
present .......................................... [9] resistant
13. Critical control points ............... Recommended dates of notation should be adapted depending of expression of symptoms on controls.
Source: ISF  isf@worldseed.org

Ad. 49: Resistance to Phytophthora capsici (Pc)

Maintenance of inoculum
Inoculum and type of medium: Phytophthora capsici strain 101, to be cultivated on V8 juice-agar (1%) in Petri's dishes.

Conduct of test
Growth stage of plants: around eight-week old plants, grown in greenhouse (stage: first flower bud)
Temperature: 22°C
Light: 12 hours/day
Method of inoculation: Plants are cut just below the point of first branching. A disc of mycelium of 4 mm in diameter should be used as inoculum. The disc is placed on the freshly cut stem. The top of the stem is wrapped with a piece of aluminium foil, to keep it wet. Infected plants are transferred to a growth chamber kept at 22°C.

Duration of test:
From sowing to inoculation: between 6 and 8 weeks
From inoculation to scoring: first scoring: 7 days
second scoring: 14 days
final scoring: 21 days
Number of plants tested: 20 plants

Scoring: The length of necrosis on the stem, induced by the fungus development, is recorded once a week during 3 weeks, on each plant. The aluminium foil on the top of the stem should be removed 7 days after the inoculation. The first reading should take place immediately after the removal of the aluminium foil. Subsequent scoring should be made on the 14th and 21st day counting from the day of inoculation. The distance (in mm) between the lowest point reached by the necrosis and the top of the stem should be recorded.

Standard varieties: Susceptible: Yolo Wonder
Resistant: Chistera, Favolor, Solario, Phylo 636 (given in the order of their level of resistance)
Ad. 50: Resistance to *Cucumber mosaic Virus* (CMV)

**Maintenance of pathotypes**

**Strain:** Fulton  
**Type of medium:** On susceptible plants, *Vinca rosea*  
**Special conditions:** -

**Inoculum production:** Crushing of 1g of fresh leaves of *Vinca rosea* in 4 ml of Phosphate buffer 0.03M pH 7 + DIECA (diethyl dithiocaremate de sodium) (1 for 1000) + 300 mg of activated carbon + 80 mg of carborundum

**Execution of test:**

**Growth stage of plants:** Young plants at the stage of developed cotyledons. First leaf non-pointing  
**Number of plants:** 20 plants  
**Growing conditions:** 22°C, 12 hours of light  
**Growing method:** Raising of plants in climated room  
**Method of inoculation:** Mechanical rubbing of cotyledons with a virus solution, the plants are kept in darkness for 48 hours

**Duration of test:**

From sowing to inoculation: 12 to 13 days  
From inoculation to reading: 3 readings at 10, 15 and 21 days after inoculation

**Standard varieties:**

**Susceptible variety:** Yolo Wonder  
**Tolerant (T) or resistant (R) varieties:** Milord (T), Vania (R)

Ad. 51: Resistance to *Tomato spotted wilt virus* Pathotype 0 (TSWV: 0)

**Maintenance of pathotypes:**

**Type of medium:** on susceptible pepper plants or freezing at -70°C

**Execution of test:**

**Growth stage of the plants:** one or two leaves expanded  
**Temperature:** day: 20°C, night: 20°C  
**Light:** extra light in winter  
**Growing method:** glasshouse  
**Inoculation medium:** 0.01 M PBS buffer with 0.1% sodium sulfite freshly added  
**Method of inoculation:** mechanical, rubbing with carborundum on cotyledons,  
**Special conditions:** keep inoculum suspension cool during inoculation

**Duration of test:**

From sowing to inoculation: 20 days  
From inoculation to reading: 14 to 20 days

**Number of plants tested:** 20 plants  
**Remarks:** beware of thrips; resistance will break down when temperature is higher than 25°C

**Standard varieties**

**Susceptible:** Bruinsma Wonder  
**Resistant:** Explorer, Prior
Ad. 52: Resistance to *Xanthomonas campestris pv. Vesicatoria* (Xcv)

**Maintenance of pathotypes**
Type of medium: PDA (Potato, Dextrose, Agar) medium
Special conditions: 48 hours *Xanthomonas campestris pv. vesicatoria* culture. Adjusting inoculum concentration of bacteria-cellular $10^7$.

**Execution of test**
Growth stage of plants: 6th to 8th true leaves
Temperature: 24°C night, 25°C day
Relative humidity: 80%
Light: 30 000 lx, day length 16 hours
Growing method: Sowing in boxes in climate chamber or in glasshouse
Method of inoculation: Infiltration into abaxial surface of a leaf in 13-15 mm diameter spots
Duration of the test: 10-14 days

Number of plants tested: 15 to 30 plants

**Remarks**

**Genetics of bacteria pathotypes and resistant genotypes:**
Resistant varieties: Aladin, Camelot, ECR-20R, Kaldóm, Kalorez, Lancelot, Pasa
9. **LITERATURE**

**GENERAL INFORMATION**

Pochard, E., 1987: *Histoire du piment et recherche*, INRA Mensuel, FR, no. 29; 5-8

**Genetic Resources**

**Disease Resistance**

10. TECHNICAL QUESTIONNAIRE

The Technical Questionnaire is available on the CPVO website under the following reference:
CPVO-TQ/076/2-Rev.2
